

PSY.MARKET - V1 STATUS REPORT

Read-only product and codebase audit

12 July 2026

EXECUTIVE VERDICT

REFINED_PRD.md is the best available source of truth for intended V1 scope. The codebase is a functioning marketplace prototype, but it does not yet implement the PRD's complete V1 workflow and is not ready for a public production launch.

DOCUMENT PRECEDENCE AND DATES

- psy-market-refined-prd-v3.pdf - modified 2026-06-28 09:54 UTC; v3.0 dated 2026-02-09; image-only rendered snapshot.
- REFINED_PRD.md - modified 2026-06-28 09:48 UTC; v3.0 dated 2026-02-09; authoritative product-scope source.
- SPEC.md - modified 2026-06-28 09:48 UTC; v1.1 dated 2026-02-09; subordinate engineering design derived from PRD v3.0.

The PDF's six-minute newer filesystem timestamp reflects rendering/copying, not a newer product revision. Both Markdown documents warn that they are historical or partially stale. REFINED_PRD.md is authoritative for intended scope; the repository is authoritative for implementation status.

KEY DOCUMENT CONTRADICTIONS

- Status: headers say historical/stale, while footers say Ready for Implementation.
- Storage: PRD/SPEC prescribe Supabase Storage; primary current flows use Cloudflare R2, while legacy pages still use Supabase Storage.
- Messaging: PRD/SPEC prescribe synthetic thread IDs; current code uses conversations plus messages tables.
- Profiles: PRD uses /seller/[handle]; current canonical route is /[handle].
- Admin: PRD requires a complete /admin system; no /admin route exists.
- Notifications: email is described as opt-in but also default-on.
- Onboarding: PRD says no handle indicates incompleteness; SPEC uses user_XXXXXXXX; current signup sets the requested handle directly.
- Moderation: ban/suspend is required, but the documented schema has no persisted state for it.
- Messaging deletion: PRD excludes it in V1; current UI permits conversation deletion.

CURRENT V1 PRODUCT SCOPE

- Global, EU-focused psytrance marketplace for listing, browsing, and contacting sellers; payment and delivery remain off-platform.
- Guest browsing; authentication for selling, messaging, and profile management.
- One public profile per account with handle, display name, biography, avatar, location, social links, and creator flag.
- Validated listings with images and draft -> pending -> active -> sold lifecycle, including rejection and resubmission.
- Search, filters, sorting, infinite scrolling, and a manually managed featured carousel.
- Listing-specific realtime messaging with text, images, links, read receipts, inbox grouping, and optional email notifications.
- Admin approval/rejection, user moderation, analytics, featured controls, and 24-hour automatic approval.
- Account settings/deletion, legal pages, dynamic metadata, Open Graph, sitemap, and responsive polish.
- Out of V1: integrated payments, reviews, favorites, follows, reports, multi-profile support, automated paid promotion, multi-currency, push, stale expiry, popular sort, mobile apps, and community posts.
- Success criteria: 50+ listings; 100+ registered users; 20+ active listings; zero scam reports/positive feedback; first featured-listing sale.

DONE - VERIFIED WORKING END-TO-END

- Email/password login and logout - app/login/page.tsx, components/AuthModal.tsx, components/layout/Header.tsx, middleware.ts.

- Email signup and profile initialization - app/signup/page.tsx -> app/api/auth/signup/route.ts -> Supabase Auth and profiles; callback in app/auth/callback/page.tsx.
- Public marketplace display - homepage/category/listing/profile pages query real listings and profiles.
- Public profile routing - /[handle] loads profiles/listings; /seller/[handle] redirects there.
- Profile editing and password changes - profiles update in Supabase; avatars upload through authenticated R2 presigning.
- Direct listing creation - NewListingModal uploads to R2 and inserts into listings, but bypasses moderation.
- Listing editing - EditListingModal updates listing fields and R2 image URLs.
- Festival calendar, RSVP, and notice wall - real UI/database paths through events, vendor_events, notice_posts, and notice_reactions.
- Production build verification - npm run build passed under Next.js 14.2.35 and generated all 21 routes.

PARTIALLY DONE

- Signup/onboarding - email works; Google OAuth, dedicated onboarding, optional location, and versioned trigger proof are missing.
- Browse/search - some client-side filtering/sorting exists; q is ignored and database search, full filters, cursor pagination, and featured carousel are missing.
- Listing lifecycle - create/edit work, but listings publish directly as active; draft, pending, rejection, resubmission, sold, and moderation are absent.
- Validation - weaker than PRD, allows eight images, lacks shared/server validation, and can continue after failed uploads.
- Storage - mixed R2 and Supabase Storage implementations.
- Upload security - authentication exists, but server-side MIME, type, size, and count restrictions do not.
- Messaging - conversations, text insertion, inbox, and realtime exist; direct thread navigation and unread state are broken; images, links, complete receipts, email, and length enforcement are missing.
- View counts - displayed but never incremented.
- Navigation/footer - several dead labels and nonexistent legal/password-reset links.
- SEO - only global title and description; no canonical, dynamic listing metadata, Open Graph, or sitemap.
- Database layer - live Supabase is used, but schema, migrations, RLS, triggers, RPCs, and realtime configuration are not versioned.

NOT STARTED - IN PRD V1 SCOPE

- Google OAuth.
- Complete role-protected /admin route tree.
- Approval/rejection queue and rejection/resubmission workflow.
- User ban/suspend and role management.
- Featured management and browse carousel.
- Automatic approval after 24 hours.
- Database-backed search, filters, sorting, and infinite scroll.
- Message images, clickable links, complete receipts, and email notifications.
- Email preference management.
- My-listings/dashboard status management.
- Mark-as-sold flow.
- Self-service account deletion.
- Privacy Policy and Terms of Service pages.
- Dynamic metadata, Open Graph, and sitemap.

BUILT BUT NOT IN PRD

- Festival calendar and festival detail pages.
- Festival attendance/seller RSVPs.
- Festival notice wall with categories, realtime updates, and reactions.
- Homepage ticket display, currently hard-coded.
- Music, apparel, and jewellery editorial category landing pages.

- Conversation deletion, conflicting with PRD V1.
- Profile-type editing for artist/label/festival identities.

LAUNCH BLOCKERS - NON-FEATURE

- Public service runs npm run dev rather than a production build/server.
- No versioned database schema or RLS; authorization and reproducibility cannot be established from Git.
- Unsafe auth redirects accept unvalidated callback/next values.
- Auth callback logs token prefixes and potentially URL hashes containing auth material.
- No Impressum, Datenschutz/Privacy, AGB/Terms, or cookie-policy routes; existing legal links fail.
- Password recovery is linked but not implemented.
- R2 upload path lacks server-enforced size/type limits.
- SMTP variables are unused; no application email sender exists. Supabase confirmation email depends on external configuration.
- No error monitoring such as Sentry.
- Domain/config remains staging-oriented: psy.heytagay.com fallback is active because NEXT_PUBLIC_SITE_URL is absent.
- No committed production deployment definition, CI workflow, or health check.
- No automated tests or lint script; no runtime engine pin.
- Newsletter form is inert.
- Payments are intentionally absent and are not a blocker if V1 remains contact-only.

OPEN QUESTIONS

- Keep the full PRD V1, or reduce V1 to the simpler direct-publish marketplace?
- Require admin review and 24-hour auto-approval, or permit immediate publication?
- Standardize on Cloudflare R2 or Supabase Storage?
- Canonical profile route: /[handle] or /seller/[handle]?
- Add festival/RSVP/notice-wall functionality formally to V1?
- Confirm contact-only/off-platform launch with no payment provider.
- Legal requirement: PRD placeholders or German/EU Impressum, Datenschutz, and AGB?
- Email notifications default-on or explicit opt-in?
- Keep or remove conversation deletion?
- Remove, label, or connect static ticket cards?
- Deploy on Vercel at psy.market or on the VPS behind Cloudflare?
- Which accounts receive admin/super-admin privileges?

ORDERED V1 PUNCH LIST

1. [S] Freeze V1 decisions and reconcile the PRD.
2. [M] Capture and audit live Supabase schema, migrations, RLS, triggers, RPCs, and realtime configuration.
3. [S] Fix auth redirects/token logging and add password reset.
4. [M] Standardize and secure file uploads.
5. [L] Complete listing lifecycle and server-side validation.
6. [L] Build minimum admin/moderation system.
7. [L] Finish database-backed browse and discovery.
8. [M] Repair and complete messaging.
9. [M] Complete account controls and listing management.
10. [M] Add legal pages and repair dead UI.
11. [M] Implement SEO baseline.
12. [M] Add production operations: secrets, monitoring, health checks, tests, runtime pinning, and deployment workflow.
13. [M] Perform production-domain cutover and full launch verification.

No implementation tasks were started during this audit.
